

In the Claims:

1           1. [previously presented] A method of mobile device control comprising:  
 2           moving a surrogate under wireless control by a user;  
 3           during the moving, detecting unsuitable degradation of wireless  
 4           communications of the wireless control; and  
 5           in response to the detecting and while the surrogate is still receiving the  
 6           wireless communications, autonomously moving the surrogate to provide suitable  
 7           wireless communications of the wireless control.

1           2. [original] The method as claimed in claim 1 additionally comprising:  
 2           autonomously moving the surrogate along a previously determined route.

1           3. [currently amended] The method as claimed in claim 1 wherein:  
 2           the surrogate is in a location when the unsuitable degradation of the wireless  
 3           communications is detected;  
 4           autonomously moving the surrogate to provide suitable wireless  
 5           communications of the surrogate wireless control occurs after passage of a period of  
 6           time following the detecting of the degradation; and  
 7           the method further comprises the surrogate loitering near the location during  
 8           the passage of the period of time.

1           4. [original] The method as claimed in claim 1 wherein:  
 2           autonomously moving the surrogate includes measuring distance and  
 3           avoiding collisions by the surrogate.

1           5. [currently amended] The method as claimed in claim 1 wherein:  
 2           moving the surrogate under wireless control includes logging forward motion  
 3           using at least one of dead reckoning, odometry, directional measurement,  
 4           differential wheel rotation, or ~~and~~ a combination thereof.

1           6. [currently amended] The method as claimed in claim 1 wherein:  
2           autonomously moving the surrogate uses logged information of forward  
3 movement using at least one of dead reckoning, odometry, directional  
4 measurement, differential wheel rotation, or ~~and~~ a combination thereof; and  
5           autonomously moving the surrogate uses waypoints back along a forward  
6 movement path for backtracking movement.

1           7. [previously presented] A method of mobile telepresencing comprising:  
2           moving a surrogate under real-time wireless control by a user;  
3           autonomously moving the surrogate to an area with adequate wireless  
4 coverage to regain wireless control when the wireless control is lost for a period of  
5 time; and  
6           while the surrogate is autonomously moving, activating a human perceptible  
7 indicator which is perceptible to humans in the presence of the surrogate.

1           8. [original] The method as claimed in claim 7 additionally comprising:  
2           autonomously moving the surrogate along at least one of a previously  
3 determined route, a distance, a destination, a direction, or a combination thereof.

1           9. [original] The method as claimed in claim 7 wherein:  
2           losing wireless control includes degradation of the control to a threshold  
3 level;  
4           autonomously moving the surrogate to regain wireless control occurs after a  
5 period of time.

1           10. [original] The method as claimed in claim 7 wherein:  
2           autonomously moving the surrogate includes;  
3           backtracking while measuring distance and avoiding collisions by the  
4 surrogate;  
5           stopping the surrogate for an obstacle; and  
6           resuming backtracking after removal of the obstacle.

1           11. [currently amended] The method as claimed in claim 7 wherein:  
2           moving the surrogate under wireless control includes logging forward motion  
3           using at least one of dead reckoning, odometry, directional measurement,  
4           differential wheel rotation, or ~~and~~ a combination thereof.

1           12. [currently amended] The method as claimed in claim 7 wherein:  
2           autonomously moving the surrogate to backtrack uses logged information of  
3           forward movement using at least one of dead reckoning, odometry, directional  
4           measurement, differential wheel rotation, or ~~and~~ a combination thereof;  
5           autonomously moving the surrogate to backtrack uses a slower speed than  
6           forward speed; and  
7           autonomously moving the surrogate uses waypoints back along a forward  
8           movement path for backtracking movement considering the slower speed of  
9           backtracking.

1           13. [previously presented] A mobile device control system comprising:  
2           a surrogate movable under wireless control by a user; and  
3           a computer/transceiver system on the surrogate for detecting loss of the  
4           wireless control, configuring the surrogate to loiter for a non-zero amount of time  
5           following the loss of the wireless control near a location at which the loss of the  
6           wireless control was detected, and moving the surrogate to regain wireless control  
7           independently of the wireless control after passage of the a non-zero amount of  
8           time following the loss of the wireless control.

1           14. [original] The system as claimed in claim 13 wherein:  
2           the computer/transceiver system for autonomously moving the surrogate  
3           along a previously determined route.

1           15. [previously presented] The system as claimed in claim 13 wherein:  
2           the computer/transceiver system for autonomously moving the surrogate to  
3           regain wireless control occurs after the surrogate remains stationary for the non-  
4           zero amount of time.

1           16. [original] The system as claimed in claim 13 wherein:  
2           the computer/transceiver system for autonomously moving the surrogate  
3 includes measuring distance and avoiding collisions by the surrogate.

1           17. [cancelled]

1           18. [currently amended] The system as claimed in claim 13 wherein:  
2           the computer/transceiver system uses logged information of forward  
3 movement using at least one of dead reckoning, odometry, directional  
4 measurement, differential wheel rotation, or ~~and~~ a combination thereof; and  
5           the computer/transceiver system calculates waypoints back along a forward  
6 movement path for backtracking movement.

1           19. [previously presented]A mobile telepresencing system comprising:  
2           a surrogate movable under wireless control by a user; and  
3           a computer/transceiver system for determining when the wireless control is  
4 lost and responsive to the determining, autonomously moving the surrogate to an  
5 area not currently receiving adequate coverage of the wireless control, but in which  
6 the surrogate previously experienced adequate coverage of the wireless control, to  
7 regain adequate coverage of the wireless control.

1           20. [original] The system as claimed in claim 19 additionally comprising:  
2           the computer/transceiver system for autonomously moving the surrogate  
3 along at least one of a previously determined route, a distance, a destination, a  
4 direction, or a combination thereof.

1           21. [original] The system as claimed in claim 19 wherein:  
2           the computer/transceiver system for determining degradation of the wireless  
3 control to a threshold level;  
4           the computer/transceiver system for autonomously moving the surrogate to  
5 regain wireless control occurs after a period of time.

1           22. [original] The system as claimed in claim 19 wherein:  
2           the computer/transceiver system for autonomously moving the surrogate  
3 includes;  
4           backtracking means for measuring distance and avoiding collisions by the  
5 surrogate during backtracking;  
6           stopping means for stopping the surrogate for an obstacle; and  
7           means for resuming backtracking after removal of the obstacle.

1           23. [cancelled]

1           24. [currently amended] The system as claimed in claim 19 wherein:  
2           the computer/transceiver system uses logged information of forward  
3 movement using at least one of dead reckoning, odometry, directional  
4 measurement, differential wheel rotation, or ~~and~~ a combination thereof for  
5 backtracking;  
6           the computer/transceiver system provides a slower speed than forward  
7 speed for backtracking by the surrogate; and  
8           the computer/transceiver system uses waypoints back along a forward  
9 movement path for backtracking movement considering the slower speed of  
10 backtracking.

1           25. [previously presented] The method as claimed in claim 1 wherein:  
2           the detecting comprises comparing a performance parameter associated with  
3 the wireless communications with a threshold.

1           26. [previously presented] The method as claimed in claim 25 wherein:  
2           ~~the performance parameter comprises a bandwidth and the threshold~~  
3 ~~comprises an acceptable bandwidth~~ the detecting comprises determining that a  
4 current non-zero data rate at which the surrogate is successfully transmitting data  
5 via the wireless communications is less than a desired data rate.

1           27. [currently amended] The method as claimed in claim 26 further  
2 comprising:  
3           prior to the detecting, wirelessly transmitting a video signal at or above the  
4 desired rate ~~acceptable bandwidth~~ from the surrogate to the user.

1           28. [previously presented] The method as claimed in claim 10 further  
2 comprising:  
3           prior to the resuming of the backtracking, sensing removal of the obstacle;  
4 and  
5           wherein the resuming is responsive to the sensing.

1           29. [new] The method as claimed in claim 25 wherein the detecting  
2 comprises determining that a current transmission delay associated with packets  
3 received by the surrogate is greater than an acceptable transmission delay.

1           30. [new] The system of claim 13 wherein the computer/transceiver  
2 system is configured to configure the surrogate to remain stationary near the  
3 location for the non-zero amount of time following the loss of the wireless control.
